

SIMPLE 500

*blessed indeed is the man who hears
many gentle voices call him father!*
— lydia maria child

hell is full of dads. — george carlin

instead of making your sorkariak flee
their children like some kind of venereal
disease, you will make the young'uns fly
the nest.

instead of leaving its offspring behind to
fight each other, why would the offspring
not themselves leave? that way, every
time a cell bears children, the species
would swarm in larger numbers in all
directions.

your sorkariak will need two life stages:
they will spend a short childhood fleeing
their parents before becoming adults,
eager to shred thy neighbour to pieces
like their parents and their parents'
parents before them.

**remove the code that makes a cell
flee after breeding and replace
it with a conditional at the very
beginning of the code that, if the
cell's age is smaller than 5, steps
500 u.**

this condition will of course be met only
once in a the life of a sorkari.
