

I WANT YOU

all life everywhere, from the dullest to the most sophisticated, from the humblest fungus to the most glorious palin supporter, all life, sooner or later, all life must seek out and find other life around it. throw your txorikumeak at whatever seems to be around them.

i want you so bad, it's driving mad, it's driving me mad. — john lennon and paul mccartney
humans use their five senses to search for food, to feel, smell and taste it when they find it, and to feel, fondle and grope each other.

cells have but one sense: proximity. a cell may know the distance that separates from its closest neighbour. it may also turn toward its closest neighbour with instruction *approach*.

use instructions *approach* and *step* to throw your cells at each other and at diamonds.

instruction *approach* by itself only changes the orientation of cell. it does not change its position.
