

*alas! lord and lady dalhousie are dead, and buried at last,
which causes many people to feel a little downcast.*
— william mcgonagall

DJOS VITE

now, what if it turned out that prudence
pays off more than impatience does?
prudence of the cat that plays with the
mouse before it breaks its neck, that toys
with its prey to get a feel for it, perhaps
to make sure it isn't diseased, before
biting its life off without the slightest
trace of compuction or doubt, what if that
prudence made cats stronger?

your sorkaria will watch its neighbour to
guess if it is aproaching. it will play hard to
get: it will approach its neighbour only if
its neighbour is not approaching.

**replace the code that runs toward
the neighbouring cell with a
conditional that determines if that
cell is approaching and that, if it
is, dashes toward it by 150 units.**

to determine if the neighbouring cell is
approaching, push its proximity, wait a bit,
push proximity again, compare.

the little critters will buzz around and past
each other without appearing to really be
on the hunt. they will looking like they are
wasting their time.
