

CHROMOSOMES 2

chromosomes may be named or remain unnamed. (VI:3)

the main chromosome may be given no name or any name. (VI:4)

a chromosome may be invoked either through its number, for example, "(3)" for the fourth chromosome, or through its name if it has one. (VI:5)

skip this level if you skipped the previous one.

know that you may give your chromosomes names like *approach-fast*, *spin* or *run-for-dear-life*.

should you run out of inspiration, like the folks over at audi that came up with the name "e-tron", you might catch a breath of poetry (or mild stupefacients) coming from the celebrity parents of little bronx mowgli, diesel, daisy boo and tallulah belle, or or from the raving ideologues of early communist russia who named their shoeless brats vaterpezhekosma (short for "valentina tereshkova, first woman cosmonaut" in russian) or lengenmir ("lenin, world genius").

include the name in parentheses at the beginning of the chromosome. elsewhere, simply use the name as you would any instruction of the language.

the example from the previous level may be coded:

```
500 repeat step
infinity repeat go-toward
---
```

```
(go-toward) approach step
```

take your strain from the previous level. give a name to chromosome 1 and use it in the main chromosome.
